30

In accordance with the enclosed Remarks, please amend the claims in the aboveidentified application as follows:

1. (Currently Amended) An interdigital <u>lateral field excitation Bulk bulk</u> acoustic <u>Mave</u> transducer device, comprising:

a first comb of interdigital electrode fingers deposited on a surface of a piezoelectric substrate interleaves with an opposing second comb of interdigital electrode fingers deposited on said surface;

said first comb being connected to a first bus bar and said second comb being connected to a second bus bar, said first and second bus bars being conductive and defining an active region on said surface, said piezoelectric substrate having a substrate acoustic impedance;

a first one electrode of said first comb and a second electrodeone of said second comb having an opposite polarity and an acoustic impedance matching said substrate acoustic impedance, being paired, positioned parallel and proximate to one another further comprising a period, said period having a period gap, G1, separating said first electrode from one and said second electrodeone, said period gap G1 having a first edge opposing said first electrodeone and a second edge opposing said second electrodeone;

said period having a plurality of electrode edges separated by an electrode gap, G2, said electrode gap G2 being wider than, and parallel to, said period gap G1; a dielectric coating covers at least a portion of said period;

an exciting AC voltage placed across said period generates a plurality of alternating lateral electrical fields that alternate in polarity and a plurality of piezoelectric

mechanical surface tractions produced at said electrode edges being spatially distributed over said surface;

said period having a given metallization ratio;

said device having a multitude of periods;

said alternating lateral electrical fields, said multiple periods, and said dielectric coating and the positioning of said first electrode and said second electrode within each period generate a low-voltage, planar, lateral field excitation Bulk Acoustic Wave bulk acoustic wave propagating away from said surface that suppresses production of a surface acoustic wave; and

said <u>Bulk Acoustic Wave</u> <u>bulk acoustic wave</u> provides a lateral electric field with a constant magnitude substantially uniform over said active area, reducing a plurality of electrode field intensity spikes, with a phase progression substantially parallel to said surface, producing a plurality of spatially distributed lateral electric fields pointing substantially in a single direction over said active area.

10

5

- 2. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 <u>Wave bulk acoustic transducer device</u>, as recited in claim 1, further comprising said first bus bar and said second bus bar being separated by a width, W.
- 3. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 <u>Wave bulk acoustic</u> transducer device, as recited in claim 2, further comprising each of said first comb of electrode fingers having a first length, L₁, and a first finger width, t₁.
- 4. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>
 25 <u>Wave bulk acoustic transducer device</u>, as recited in claim 3, further comprising each of said second comb of electrode fingers having a second length, L₂, and a second finger width t₂.
- 5. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 Wave <u>bulk acoustic transducer device</u>, as recited in claim 4, further comprising:

said active region having an electrode overlap width measured according to the formula:

$$L_1 + L_2 - W$$
; and

an active region width that produces a plurality of acoustic waves.

5

10

15

- 6. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u> Wave <u>bulk acoustic</u> transducer device, as recited in claim 5, further comprising a tangential component of an electric field, E, that is parallel to said surface within said period gap G1 <u>and</u> remains unaltered by a dielectric permittivity of said dielectric coating.
- 7. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 <u>Wave bulk acoustic transducer device</u>, as recited in claim 6, further comprising a normal component of said electric field, E, being perpendicular to said surface is modified according to the formula:

$$E_{n1} = (\epsilon_2/\epsilon_1)E_{n2}$$

where said E_{n1} refers to said dielectric coating, and said E_{n2} refers to said substrate.

20

30

- 8. (Canceled) The interdigital bulk acoustic transducer device, as recited in claim 7, further comprising said first comb of electrode fingers being composed of a conductive metal.
- 9. (Canceled) The interdigital bulk acoustic transducer device, as recited in claim
 8, further comprising said second comb of electrode fingers being composed of a conductive metal.
 - 10. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 Wave <u>bulk acoustic transducer device</u>, as recited in claim 97, further comprising:

 said dielectric coating is a dielectric coating strip;

 said electrode gap G2 remaining uncovered; and

said portion being:

10

20

all of said second <u>electrodeone</u>; and a section of the period gap G1 adjacent to said second <u>electrodeone</u>.

11. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic-transducer device</u>, as recited in claim 97, further comprising:

said dielectric coating is a dielectric coating strip; and

said electrode gap G2 remaining uncovered; and

said portion being:

a section of said first <u>electrode</u>one adjacent to said period gap G1; said period gap G1; and a section of said second electrodeone adjacent to said period gap G1.

- 12. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 Wave <u>bulk acoustic</u> transducer device, as recited in claim 97, further comprising:

 said dielectric coating is a dielectric coating strip; and

 said electrode gap G2 remaining uncovered; and

 said portion being:
 - a section of said first <u>electrodeone</u> adjacent to a narrowed period gap G1; said narrowed period gap G1; and a section of said second <u>electrode</u> one adjacent to said narrowed period gap G1.
- 13. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 Wave <u>bulk acoustic-transducer device</u>, as recited in claim 97, further comprising:

 said dielectric coating is a dielectric coating strip;

 said electrode gap G2 remaining uncovered;

 said second edge of the period gap G1 extends underneath a rectangular ledge of said second <u>electrodeone</u>; and

14. (Currently Amended) The interdigital lateral field excitation Bulk Acoustic

Wave bulk acoustic transducer device, as recited in claim 97, further comprising:

said dielectric coating is a dielectric coating strip;

said electrode gap G2 remaining uncovered;

said second electrode having an overhanging ledge extending over said first

one-electrode and said period gap G1; and

said portion being said period gap G1;

5

25

30

- 15. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>
 10 <u>Wave bulk acoustic-transducer device</u>, as recited in claim 14, further comprising said overhanging ledge having a slope.
- 16. (Currently Amended) The interdigital lateral field excitation Bulk Acoustic

 Wave bulk acoustic transducer device, as recited in claim 97, further comprising:

 said dielectric coating is a dielectric coating strip;

 said electrode gap G2 remaining uncovered;

 said first electrode having a first rectangular ledge extending over said first edge;

said second <u>electrodeone</u> having a second rectangular ledge extending over said second edge; and said portion being said period gap G1.

17. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic transducer device</u>, as recited in claim 97, further comprising:

said conductive metal for the electrode fingers of said first and said second combs

being aluminum;

said dielectric coating being a plurality of dielectric coating strips;
said electrode gap G2 remaining substantially uncovered;
a first dielectric coating strip covers an electrode edge of said first electrodeone;
said second electrodeone having a rectangular ledge extending over said second edge of the period gap G1;

a second dielectric coating strip covers an electrode edge of said second electrodeone; and

said portion being:

5

10

15

20

25

30

said electrode edge of the first <u>electrodeone</u>; said electrode edge of the second <u>electrodeone</u>; and said period gap G1 covered by a third dielectric coating strip.

18. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic transducer device</u>, as recited in claim <u>97</u>, further comprising:

said conductive metal for the electrode fingers of said first and said second combs being aluminum;

said dielectric coating being a plurality of dielectric coating strips;

said electrode gap G2 remaining substantially uncovered;

a first dielectric coating strip covers an electrode edge of said first electrode ene;

said second <u>electrodeone</u> having an overhanging ledge extending over said second edge of the period gap G1;

a second dielectric coating strip covers an electrode edge of said second electrodeone; and

said portion being:

said electrode edge of the first <u>electrodeone</u>; said electrode edge of the second <u>electrodeone</u>; and said period gap G1 covered by a third dielectric coating strip.

- 19. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 <u>Wave bulk acoustic transducer device</u>, as recited in claim 18, further comprising said overhanging ledge having a slope.
- 20. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 <u>Wave bulk acoustic</u> transducer device, as recited in claim 97, further comprising:

 said <u>conductive metal for the electrode fingers of said first electrodes and said second electrodes combs being composed of aluminum;</u>

said dielectric coating being a plurality of dielectric coating strips; said electrode gap G2 remaining substantially uncovered; a first dielectric coating strip covers an electrode edge of said first <u>electrodeone</u>; said first <u>electrodeone</u> having a first rectangular ledge extending over said first

said second <u>electrodeone</u> having a second rectangular ledge extending over said second edge;

a second dielectric coating strip covers an electrode edge of said second electrodeone; and

said portion being:

5

10

15

20

25

30

edge;

said electrode edge of the first <u>electrodeone</u>; said electrode edge of the second <u>electrodeone</u>; and said period gap G1 covered by a third dielectric coating strip.

21. (Currently Amended) An interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic transducer</u>, comprising:

a first comb of interdigital electrode fingers deposited on a surface of a piezoelectric substrate interleaves with an opposing second comb of interdigital electrode fingers deposited on said surface;

said first comb being connected to a first bus bar and said second comb being connected to a second bus bar, said first and second bus bars being conductive and defining an active region on said surface, said piezoelectric substrate having a substrate acoustic impedance;

a first <u>electrode</u> one of said first comb and a second <u>electrode</u> one of said second comb having an opposite polarity and an acoustic impedance matching said substrate acoustic impedance, being paired, positioned parallel and proximate to one another further comprising a period, said period having a period gap, G1, separating said first <u>electrode</u> from one and said second one <u>electrode</u>, said period gap G1 having a first edge opposing said first <u>electrode</u> one and a second edge opposing said second <u>electrode</u>one;

said period having a plurality of electrode edges separated by an electrode gap, G2, said electrode gap G2 being wider than, and parallel to, said period gap G1;

a plurality of dielectric coating strips covers at least a portion of said period, said electrode gap G2 remaining substantially uncovered;

an exciting AC voltage placed across said period generates a plurality of alternating lateral electrical fields that alternate in polarity and a plurality of piezoelectric mechanical surface tractions produced at said electrode edges being spatially distributed over said surface;

said period having a given metallization ratio;

a first dielectric coating strip covers an electrode edge of said first <u>electrode one</u>; said second <u>electrode one</u> having a second ledge extending over said second edge of said period gap G1;

a second dielectric coating strip covers an electrode edge of said second <u>electrode</u> one;

said portion being:

5

10

15

20

25

said electrode edge of the first <u>electrode</u> one; said electrode edge of the second <u>electrode</u> one; and

said period gap G1 covered by a third dielectric coating strip;

said transducer having a multitude of periods;

said alternating lateral electrical fields, said multiple periods and, said plurality of dielectric coating strips and positioning of said first electrode and said second electrode within each period generate a low-voltage, planar, lateral field excitation Bulk Acoustic Wavebulk acoustic wave propagating away from said surface that suppresses production of a surface acoustic wave; and

said <u>Bulk Acoustic Wave</u> <u>bulk acoustic wave</u> provides a lateral electric field with a constant magnitude substantially uniform over said active area, reducing a plurality of electrode field intensity spikes, with a phase progression substantially parallel to said surface, producing a plurality of spatially distributed lateral electric fields pointing substantially in a single direction over said active area.

22. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

Wave <u>bulk acoustic-transducer</u>, as recited in claim 21, further comprising said first comb of electrode fingers being composed of aluminum.

23. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic-transducer</u>, as recited in claim 22, further comprising said second comb of electrode fingers being composed of aluminum.

5

10

15

24. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic transducer</u>, as recited in claim 23, further comprising:

said first bus bar and said second bus bar being separated by a width, W;

each of said first comb of electrode fingers having a first length, L₁, and a first

finger width, t₁; and

each of said second comb of electrode fingers having a second length, L_2 , and a second finger width t_2 .

25. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

Wave bulk acoustic transducer, as recited in claim 24, further comprising:

said active region having an electrode overlap width measured according to the formula:

 $L_1 + L_2 - W$; and

an active region width that produces a plurality of acoustic waves.

20

26. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic transducer</u>, as recited in claim 25, further comprising a tangential component of an electric field, E, that is parallel to said surface within said period gap G1 and remains unaltered by a dielectric permittivity of said dielectric coating.

25

27. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

<u>Wave bulk acoustic-transducer</u>, as recited in claim 26, further comprising:

a normal component of said electric field, E, being perpendicular to said surface is modified according to the formula:

30
$$E_{n1} = (\epsilon_2/\epsilon_1)E_{n2}$$

where said E_{n1} refers to said plurality of dielectric coating strips and said E_{n2} refers to said substrate.

- 28. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 5. <u>Wave bulk acoustic transducer</u>, as recited in claim 27, further comprising <u>further</u>

 comprising said second ledge being rectangular.
 - 29. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 <u>Wave bulk acoustic-transducer</u>, as recited in claim 28, further comprising said first

 <u>electrode one</u> having a first rectangular ledge extending over said first edge of the period

 gap G1.
 - 30. (Currently Amended) The interdigital <u>lateral field excitation Bulk Acoustic</u>

 <u>Wave bulk acoustic</u> transducer, as recited in claim 27, wherein said second ledge is an overhanging ledge sloping downward away from said first <u>electrode one</u>.
 - 31. (Currently Amended) A method for exciting <u>lateral field excitation Bulk</u>

 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, comprising the steps of:

depositing a first comb of interdigital electrode fingers on a surface of a piezoelectric substrate;

depositing a second comb of interdigital electrode fingers on said surface opposing, and interleaved with, said first comb, said piezoelectric substrate having a substrate acoustic impedance;

connecting said first comb to a first bus bar;

10

15

20

25

30

connecting said second comb to a second bus bar, said first and second bus bars being conductive and defining an active region on said surface;

aligning a first <u>electrode</u> one of said first comb and a second <u>electrode</u> one of said second comb into a pair, said first <u>electrode</u> one and said second <u>electrode</u> one being positioned parallel and proximate to one another and having an opposite polarity and an acoustic impedance matching said substrate acoustic impedance, said pair further

<u>from one and</u>-said second <u>electrodeone</u>, said period gap G1 having a first edge opposing said first electrode one and a second edge opposing said second electrode one;

forming said period with a plurality of electrode edges separated by an electrode gap, G2, said electrode gap G2 being wider than, and parallel to, said period gap G1;

covering at least a portion of said period with a dielectric coating;

placing an exciting AC voltage across said period to generate a plurality of alternating lateral electrical fields that alternate in polarity and a plurality of piezoelectric mechanical surface tractions produced at said electrode edges being spatially distributed over said surface;

providing said period with a given metallization ratio;

forming a multitude of periods;

5

10

15

20

25

generating a low-voltage, planar, lateral field excitation <u>Bulk Acoustic Wave bulk</u> acoustic wave propagating away from said surface that suppresses production of a surface acoustic wave from said alternating lateral electrical fields, said multiple periods and, said dielectric coating and positioning said first electrode and said second electrode within each period; and

providing a lateral electric field with a constant magnitude substantially uniform over said active area, reducing a plurality of electrode field intensity spikes, with a phase progression substantially parallel to said surface from said <u>Bulk Acoustic Wavebulk</u> acoustic wave, and producing a plurality of spatially distributed lateral electric fields pointing substantially in a single direction over said active area.

- 32. (Currently Amended) The method for exciting <u>lateral field excitation Bulk Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 31, wherein a tangential component of an electric field, E, that is parallel to said surface within said period gap G1 <u>and remains unaltered by a dielectric permittivity of said dielectric coating.</u>
- 33. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>
 30 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in

claim 32, wherein a normal component of said electric field, E, being perpendicular to said surface is modified according to the formula:

$$E_{n1} = (\varepsilon_2/\varepsilon_1)E_{n2}$$

10

25

where said E_{n1} refers to said dielectric coating, and said E_{n2} refers to said substrate.

- 34. (Canceled) The method for exciting <u>bulk acoustic waves</u> bulk acoustic waves with interdigital electrode fingers, as recited in claim 33, further comprising the step of forming said first comb of electrode fingers from a conductive metal.
- 35. (Canceled) The method for exciting <u>bulk acoustic waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 34, further comprising the step of forming said electrode fingers of the second comb from said conductive metal.
- 36. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>

 <u>Acoustic Waves bulk acoustic waves</u>-with interdigital electrode fingers, as recited in claim <u>3533</u>, further comprising the step of forming said dielectric coating with a plurality of dielectric coating strips.
- 37. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>

 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

forming said dielectric coating with a dielectric coating strip; permitting said electrode gap G2 to remain uncovered; and providing said portion over:

all of said second <u>electrode</u> one; and a section of the period gap G1 adjacent to said second one <u>electrode</u>.

38. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>
30 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

forming said dielectric coating with a dielectric coating strip; permitting said electrode gap G2 to remain uncovered; and forming said portion over:

5

10

15

25

30

a section of said first <u>electrode</u> one adjacent to said period gap G1; said period gap G1; and a section of said second one <u>electrode</u> adjacent to said period gap G1.

39. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>

<u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

forming said dielectric coating with a dielectric coating strip; permitting said electrode gap G2 to remain uncovered; and forming said portion over:

a section of said first <u>electrode</u> one adjacent to a narrowed period gap G1; said narrowed period gap G1; and a section of said second one <u>electrode</u> adjacent to said narrowed period gap G1.

40. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>
20 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

forming said dielectric coating with a dielectric coating strip;

permitting said electrode gap G2 to remain uncovered; and

configuring said second edge of the period gap G1 to extend underneath a

rectangular ledge of said second electrode one; and

forming said portion over said period gap G1.

41. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>

<u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

forming said dielectric coating with a dielectric coating strip;

permitting said electrode gap G2 to remain uncovered;

configuring said second <u>electrode</u> one with an overhanging ledge extending over said first <u>electrode</u> one and said period gap G1; and

forming said portion over said period gap G1.

5

10

15

- 42. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>
 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 41, further comprising the step of forming said overhanging ledge with a slope.
- 43. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>

 <u>Acoustic Waves bulk acoustic waves</u>-with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

forming said dielectric coating with a dielectric coating strip; permitting said electrode gap G2 to remain uncovered;

configuring said first one electrode with a first rectangular ledge extending over said first edge;

configuring said second <u>electrode</u> one with a second rectangular ledge extending over said second edge; and

forming said portion over said period gap G1.

20

25

30

44. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>
<u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

selecting aluminum as said conductive metal;

forming said dielectric coating with a plurality of dielectric coating strips; permitting said electrode gap G2 to remain substantially uncovered;

locating a first dielectric coating strip over an electrode edge of said first <u>electrode</u> one;

configuring said second <u>electrode</u> one with a rectangular ledge extending over said second edge of the period gap G1;

locating a second dielectric coating strip over an electrode edge of said second electrode one; and

forming said portion from:

said electrode edge of the first <u>electrode one</u>; said electrode edge of the second <u>electrode one</u>; and covering said period gap G1 with a third dielectric coating strip.

45. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>

<u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

selecting aluminum as said conductive metal;
forming said dielectric coating with a plurality of dielectric coating strips;
permitting said electrode gap G2 to remain substantially uncovered;
locating a first dielectric coating strip over an electrode edge of said first electrode

15 one;

20

25

5

10

configuring said second <u>electrode</u> one with an overhanging ledge extending over said second edge of the period gap G1;

locating a second dielectric coating strip over an electrode edge of said second one electrode; and

forming said portion from:

said electrode edge of the first <u>electrode one</u>; said electrode edge of the second <u>electrode one</u>; and covering said period gap G1 with a third dielectric coating strip.

- 46. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>

 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 45, further comprising the step of forming said overhanging ledge with a slope.
- 47. (Currently Amended) The method for exciting <u>lateral field excitation Bulk</u>
 30 <u>Acoustic Waves bulk acoustic waves</u> with interdigital electrode fingers, as recited in claim 36, further comprising the steps of:

selecting aluminum as said conductive metal;
forming said dielectric coating with a plurality of dielectric coating strips;
permitting said electrode gap G2 to remain substantially uncovered;
locating a first dielectric coating strip over an electrode edge of said first electrode

configuring said first <u>electrode</u> one with a first rectangular ledge extending over said first edge of the period gap G1;

configuring said second <u>electrode</u> one with a second rectangular ledge extending over said second edge of the period gap G1;

locating a second dielectric coating strip over an electrode edge of said second electrode one; and

forming said portion from:

5

10

15

one;

said electrode edge of the first <u>electrode one</u>; said electrode edge of the second <u>electrode one</u>; and covering said period gap G1 with a third dielectric coating strip.
